Re Item V.

- The following document is referred to in this communication:D1: EP 0 086 107 A (PHILIP MORRIS INC) 17 August 1983 (1983-08-17)
- Document D1, which is considered to represent the most relevant state of the art, discloses a method of detecting and rejecting faulty cigarettes from which the subject matter of claim 1 differs in that movable sensors coupled with a rejecting device move along a trajectory to inspect the cigarettes in all channels.
- 2.1 The subject-matter of claim 1 is therefore novel (Article 33(2) PCT). The problem to be solved by the present invention may be regarded as providing a method which allows prompt detection and practically simultaneous rejection of defective cigarettes from a number of cigarettes forming a layer in the feeding system.
- 2.2 The solution to this problem proposed in claim 1 of the present application is considered as involving an inventive step (Article 33(3) PCT), since there is no suggestion in the available prior art of such a movable detection and rejection device.
- 3. Claims 2 to 20 are dependent on claim 1 and therefore also satisfy the requirements of novelty and inventive step.
